

Package: svFast (via r-universe)

May 26, 2026

Type Package

Version 0.1.0

Title 'SciViews::R' - Fast and Parallelized R Functions

Description A Series of Fast Math and Stat Functions, Parallelized using 'RcppParallel'.

Maintainer Philippe Grosjean <phgrosjean@sciviews.org>

Depends R (>= 4.2.0), stats (>= 4.2.0)

Imports Rcpp (>= 1.0.10), RcppParallel (>= 5.1.7)

Suggests bench (>= 1.1.0), covr (>= 3.5.0), knitr (>= 1.42), rmarkdown (>= 2.21), spelling (>= 2.2.1), testthat (>= 3.0.0)

LinkingTo Rcpp, RcppParallel

SystemRequirements GNU make, Intel TBB, Windows: cmd.exe and cscript.exe, Solaris: g++ is required

Log_ *Logarithm (Fast Parallel Version)*

Description

Fast version of logarithmic and exponential functions (when vector size ≥ 50000). `log_()` computes the natural logarithm of x (base e by default), `log2_()` computes the base 2 logarithm, `log10_()` computes the base 10. `log1p_()` computes $\log(1 + x)$ accurately even for small x .

`exp_()` computes the exponential function. `expm1_()` computes $\exp(x) - 1$ accurately even for small x .

Usage

`log10_(x, para = 50000L)`

`log2_(x, para = 50000L)`

`log1p_(x, para = 50000L)`

`exp_(x, para = 50000L)`

`expm1_(x, para = 50000L)`

`log_(x, base = 2.71828182845905, para = 50000L)`

Arguments

<code>x</code>	vector of numeric values
<code>para</code>	the minimum length of x to use parallel computation (50000 by default)
<code>base</code>	the base of the logarithm ($e = \exp(1)$ by default)

Details

They are **not** generic functions and do not process factor, Date, POSIXt, difftime, complex, or S4 objects (use base R equivalent function instead). Data frames are processed column-wise, providing each column is compatible. All attributes are preserved.

Value

A numeric vector, matrix, or data frame with the transformed values.

See Also

[log10\(\)](#), [log2\(\)](#), [log\(\)](#), [log1p\(\)](#), [exp\(\)](#), [expm1\(\)](#)

Examples

```
log_(1:5)
log_(1:5, base = 2.5)
```

Round_

Rounding of Numbers (Fast Parallel Version)

Description

Fast version of rounding (when vector size ≥ 50000). [ceiling_\(\)](#) takes a single numeric argument x and returns a numeric vector containing the smallest integers not less than the corresponding elements of x . It is similar to [ceiling\(\)](#).

[floor_\(\)](#) takes a single numeric argument x and returns a numeric vector containing the largest integers not greater than the corresponding elements of x . It is similar to [floor\(\)](#).

[trunc_\(\)](#) takes a single numeric argument x and returns a numeric vector containing the integers formed by truncating the values in x toward 0. It is similar to [trunc\(\)](#).

[round_\(\)](#) rounds the values in its first argument to the specified number of decimal places (default 0). See 'Details' about "round to even" in [round\(\)](#) when rounding off a 5.

[signif_\(\)](#) rounds the values in its first argument to the specified number of significant digits.

Usage

```
ceiling_(x, para = 50000L)
```

```
floor_(x, para = 50000L)
```

```
trunc_(x, para = 50000L)
```

```
round_(x, digits = 0L, para = 50000L)
```

```
signif_(x, digits = 6L, para = 50000L)
```

Arguments

x	vector of numeric values
para	the minimum length of x to use parallel computation (50000 by default)
digits	integer indication the number of decimal places (<code>round_()</code>) or significant digits (<code>signif_()</code>) to be used. For <code>round_()</code> , negative values are allowed and indicate rounding to a power of ten (-2 means rounding to the nearest hundred), see <code>round()</code> .

Details

They are **not** generic functions and do not process factor, Date, POSIXt, difftime, complex, or S4 objects (use base R equivalent function instead). Data frames are processed column-wise, providing each column is compatible. All attributes are preserved.

Value

A numeric vector, matrix, or data frame with the transformed values.

See Also

`ceiling()`, `floor()`, `trunc()`
`round()`, `signif()`

Examples

```
floor_(c(1.23, 4.56, -7.89))
```

 Trig_

Trigonometric Functions (Fast Parallel Version)

Description

Fast version of trigonometric functions (when vector size ≥ 50000). They respectively compute the cosine, sine, tangent, arc-cosine, arc-sine, arc-tangent, and the two-argument arc-tangent.

`cospi_(x)`, `sinpi_(x)`, and `tanpi_(x)`, compute $\cos(\pi*x)$, $\sin(\pi*x)$, and $\tan(\pi*x)$.

Usage

```
cos_(x, para = 50000L)
```

```
sin_(x, para = 50000L)
```

```
tan_(x, para = 50000L)
```

```
acos_(x, para = 50000L)
```

```
asin_(x, para = 50000L)
```

```
atan_(x, para = 50000L)
```

```
cospi_(x, para = 50000L)
```

```
sinpi_(x, para = 50000L)
```

```
tanpi_(x, para = 50000L)
```

Arguments

x	vector of numeric values
para	the minimum length of x to use parallel computation (50000 by default)

Details

They are **not** generic functions and do not process factor, Date, POSIXt, difftime, complex, or S4 objects (use base R equivalent function instead). Data frames are processed column-wise, providing each column is compatible. All attributes are preserved.

Value

A numeric vector, matrix, or data frame with the transformed values.

See Also

[cos\(\)](#), [sin\(\)](#), [tan\(\)](#), [acos\(\)](#), [asin\(\)](#), [atan\(\)](#), [atan2\(\)](#)

Examples

```
cos_(1:5)
```
